

Exsited Feature Validation and Competitor Comparison

Exsited Feature Validation and Competitor Comparison

Executive Summary

This evaluation confirms that Exsited provides a foundational inventory management system with integration capabilities, purchasing workflows, and warehouse management controls. However, several critical areas require enhancement before the platform can be positioned as a fully real-time, multi-channel, multi-warehouse inventory solution.

Key Risks Identified:

- Overselling due to missing Available-to-Promise (ATP) logic
- Incomplete multi-warehouse framework
- Limited stock transfer lifecycle
- Absence of barcode scanning and mobile support
- Weak sync monitoring and audit logging

Overview

This report evaluates whether the features promised on the **StockWise** marketing page are implemented and working in the **Exsited** platform. Each feature is validated against the live dev environment (`dev.exsited.com`) and any issues or gaps are noted. A brief competitor comparison highlights where Exsited currently matches or falls short of comparable solutions like StockWise, Cin7 Core and Unleashed.

Feature Validation Table

#	Feature	Evidence in Exsited	Working?	Improvements & Suggestions
1	Real-time inventory sync	Exsited supports real-time channel synchronisation via the Integration centre. Connected apps include Xero (accounting) and dozens of e-commerce platforms such as Amazon, eBay,		• Provide real-time sync dashboard Users cannot see sync status or error logs; there is no dashboard showing last sync time, items synced or failures. Competitors expose detailed logs and allow manual re-sync. Allow users to set sync intervals (e.g., immediate, hourly, daily) and preview the changes before

BigCommerce, Vend and Shopify.

committing.

• **On-hand vs available quantities**

Exsited reduces Quantity on Hand when goods are committed but does not reduce Quantity Available when items are promised on sales orders, leading to overselling risk. Competitors calculate Available-to-Promise (ATP) by deducting reserved stock and future commitments.

• **Missing states**

There is no clear separation between reserved, in-transit and available quantities, and no per-warehouse routing logic. Mature systems (Unleashed, NetSuite) allocate stock when orders are created and track goods in transit.

2 Automatic stock updates across connected sales channels

The Integration centre shows connectors for Amazon, eBay, Shopify, BigCommerce, WooCommerce, Square and more

This indicates that inventory updates can flow to all sales channels.

• **Two-way update options**

Provide toggle switches to control whether stock and price changes should flow from Exsited to the channel, from the channel to Exsited, or both. Users should be able to choose per channel.

• **Limited concurrency control:**

When multiple orders arrive from different channels, there is no reservation engine to lock stock per channel; overselling can occur.

• **Sync log with alerts**

When a product is sold on one channel, inventory should update instantly across

			all connected platforms. However, if the internet connection drops, a marketplace API is slow, or rate limits are reached, the stock update may fail. Currently, there is no clear dashboard to monitor sync status, no alerts when updates fail, and no visible retry mechanism. As a result, users may not realize that synchronization has stopped, increasing the risk of overselling and order cancellations. Display the date and result of each sync operation and send alerts if a channel fails to update or if data conflicts occur.
3	Multi-warehouse visibility per item	Item records have an Inventory tab showing multiple warehouse locations and buttons to Add Inventory, Transfer Inventory and run Stock Assessment.  The system also allows enabling serialization and batch tracking for each item.	• Warehouse configuration Add a link or “Add warehouse” button on the item’s Inventory tab or allow inline creation of a new warehouse directly from that screen. This would save users from navigating into settings when they need to adjust warehouse locations. • Stock overview dashboard Quantities are stored globally; there is no breakdown by warehouse or location. Create a multi-warehouse dashboard that summarizes on-hand stock, committed stock, and available-to-promise by location. Include heat maps or graphs to quickly identify overstock or stockouts. • Reserved Stock & Safety Stock Reserved stock is inventory that has already been committed to customer orders but not yet shipped, so it should not be counted as available for sale. If the system does not clearly separate reserved stock from available stock, it can

			lead to overselling. Safety stock is a buffer kept to handle demand spikes or supplier delays. Without configurable safety stock per warehouse, businesses cannot properly manage risk across locations. The system should clearly separate on-hand, reserved, safety stock, and available quantities to support accurate planning. → export options and warnings on negative adjustments. • Stock Transfer A proper stock transfer workflow should include clear lifecycle stages such as Draft, Approved, In Transit, and Received. When stock is transferred, it should be allocated from the source warehouse and moved into an “in-transit” state, rather than immediately increasing stock in the destination warehouse. This ensures inventory remains accurate during movement and prevents double allocation or overselling. Only once the destination warehouse confirms receipt should the stock be added to its available quantity. Without this structured process, inventory visibility and control are compromised.
4	Purchase order workflows with stock receiving	Exsited has a full Purchase Orders module with a list of existing POs and a Create Purchase Order button. Each item’s Purchase Details tab	• Receiving UI and notifications Create a dedicated receiving screen to confirm quantities received. Notify users when orders are partially or fully received and automatically update inventory. • Partial receipts/back-orders

		records purchase price, currency, receive mode and last purchase price.  PO creation lets users receive stock into multiple warehouses.	Exsited does not allow receiving less than the ordered quantity or splitting receipts into multiple deliveries. Competitors like Unleashed generate back-order lines automatically when receiving part of a PO. • Supplier Lead Time Tracking The system allows users to enter an expected delivery date, but it does not track how long suppliers actually take to deliver. There is no way to measure if a supplier is often late or early, and this information is not used when calculating reorder levels. Without tracking real delivery times, businesses may reorder too late and run out of stock. The system should monitor actual delivery performance and use it to improve purchasing decisions. • Receiving Controls The system does not clearly prevent users from receiving more items than ordered or entering incorrect quantities. Without strong checks, inventory records can become inaccurate and financial data may be affected. Clear validation rules and automatic stock updates are needed to ensure reliable inventory and accounting accuracy.
5	Automated reorder alerts and stock level monitoring	In the Inventory tab, each item has options for Enable Low Stock Notification and Enable Reordering.	• Expiry & Stock-Age Management Add expiry alerts, stock-age reporting, and recommendations to clear slow-moving items. • Automated PO generation

Offer a button to create purchase orders from low-stock alerts

- **Reorder quantity**

The system automatically suggests ordering up to the threshold level instead of calculating economic order quantity or using forecasts.

- **Static Reorder Thresholds**

The current reorder logic is based on fixed minimum stock levels. It does not consider how quickly items sell, supplier lead times, seasonal demand, or safety stock buffers. This means alerts may trigger too late or too early, leading to stockouts or overstocking. A more dynamic approach that adjusts reorder levels based on sales trends and supplier delivery times would improve accuracy and reduce inventory risk.

- **No Multi-Warehouse Reorder Control**

Reorder settings are not configurable per warehouse. Businesses with multiple locations often experience different demand levels at each site, but the system applies the same logic across locations. This can result in one warehouse running out of stock while another holds excess inventory. Allowing warehouse-specific reorder thresholds would improve stock balance and operational efficiency.

- **Weak Alert Visibility & Actionability**

Low-stock alerts are not clearly displayed in a central dashboard and cannot be

			easily dismissed or actioned. Users must manually check items and create purchase orders separately. This increases workload and the risk of missing critical alerts. A consolidated reorder dashboard with direct purchase order creation would make the process more efficient and user-friendly.
6	Full stock movement history and audit trails	Item pages include an Activity tab and Relevant Records section which record status changes and related transactions. The Inventory Management description in Settings emphasises full audit trail of stock movements.	• Global movement history Implement a central audit log where users can filter by item, warehouse, user or date to see all stock movements. This is useful for audits and investigations. • Comprehensive Stock Movement Audit Control The system should maintain a permanent and non-editable record of every stock movement, including before and after quantities, the user who performed the action, the affected warehouse, document reference, and the reason for the change. Manual adjustments should require approval to reduce the risk of errors or misuse. In addition, stock movement reports should be exportable for audit and reconciliation purposes. Proper concurrency controls are also necessary to prevent data conflicts when multiple users update inventory simultaneously.
7	Direct accounting integration (Xero, MYOB, QuickBooks)	Xero and other accounting connectors such as MYOB AccountingRight Live and QuickBooks are available for connection.	*Actual processes were not tested due to lack of transactional data.

			
8	Barcode scanning	The StockWise page promises web-based barcode entry and a mobile app coming in Q2 2026. Exsited's dev environment did not display any barcode scanning interface, and there is no mobile app in the current UI.	Not Implemented
9	Batch and lot tracking / Serial number tracking	The Inventory tab includes options to Enable Serialization and Enable Batch Tracking for each item. Serial numbers and batches can be tracked when enabled.	• Batch/serial history view Add a dedicated page showing all batches or serial numbers for an item, with columns for manufacture date, expiry date, current location, and associated transactions. Users should be able to click a batch to view its entire lifecycle. • Capture manufacture dates and expiry dates Implement first-expire, first-out allocation and warnings when expired batches are selected. • Recall management There are no states for quarantined, recalled or expired batches. Competitors (Cin7 Core, Unleashed, NetSuite) provide batch recall functions and first-expire, first-out allocation. Implement batch recall functionality so that when a

			defective batch is identified, users can quickly locate and quarantine the affected stock and notify customers or suppliers. • Defaults and templates Allow suppliers to set default batch or serial tracking preferences at a product category level rather than toggling each item individually.
10	eCommerce integrations	Integration Fabric provides native connectors to Shopify, WooCommerce, BigCommerce, Amazon, eBay, Square, Vend and more. These integrations support two-way inventory updates.	• Order dashboard Create a consolidated view of orders imported from all channels with status filters (new, processing, shipped). Include quick actions to print pick lists and generate shipping labels. • SKU Mapping & Product Matching Risk SKU mapping is the process of matching product codes between Exsited and sales channels such as Shopify, Amazon, and eBay. If the SKU in a marketplace does not correctly match the SKU in Exsited, stock may not reduce properly, wrong items may be allocated, or products may be oversold. Currently, there is no clear interface to match SKUs, manage product variations, or set channel-specific stock buffers. This creates a high risk of inventory errors in multi-channel selling. • No End-to-End Integration Workflow After connecting a sales channel, there is no clear step-by-step process to complete the setup. There is no visible product mapping screen, no confirmation that inventory is syncing, no pricing sync

			controls, and no order reconciliation view. In addition, there is no dashboard showing last sync time or errors. This means users cannot easily confirm whether stock updates, order imports, or price changes are working correctly, increasing the risk of hidden integration failures.
11	Purchase order management	Purchase order creation and tracking are built into the Purchasing module; users can set expected completion dates, manage suppliers and track order status.	• Back-order handling Provide the ability to split POs or mark certain lines as back-ordered when suppliers cannot fulfil the full quantity. Update expected arrival dates accordingly. • Limited Purchase Order Status Model The Purchase Order API only supports basic statuses such as Draft, Active, or Deleted. It does not clearly reflect real business stages like Pending Approval, Partially Received, Completed, or Cancelled. This makes it difficult to track the true progress of a purchase order and limits visibility
12	Stock transfer management	Each item's Inventory tab features a Transfer Inventory button to move stock between warehouses. The Fulfillment Centre can manage pick, pack, consign and complete shipments.	• Lifecycle Transfer orders only have a Pending status; there are no states for Draft, Pending Approval, In Transit, Partially Received, Completed or Cancelled. • Validation and Role Control The system does not check whether a user has permission to access the selected warehouses. This means users might create transfers for locations they

should not control. There is also no clear way to cancel or reverse a transfer once it is created. Without proper validation and controls, inventory errors and unauthorized actions can occur.

- **In-Transit Stock Accounting**

When you move stock from one warehouse to another, the system should: Reduce available stock in the source warehouse, Mark the goods as “In Transit”, Add the stock to the destination only after it is received. Right now, creating a transfer does not clearly allocate or reserve the stock. This means the same items could still appear available for sale, which can lead to overselling or incorrect stock levels. There is also no proper status like “In Transit” to show that goods are moving between warehouses.

- **Missing Channel-Specific Controls**

Modern multi-channel systems allow businesses to set different stock buffers, pricing rules, and warehouse allocations for each sales channel. They also support duplicate order detection and automatic currency conversion. Exsited currently does not show these controls. Without channel-specific settings, all platforms use the same stock and pricing rules, which increases the risk of overselling, incorrect data between systems, and financial reconciliation problems across marketplaces.

Observations

1. **Mobile and scanning features are missing:** The StockWise marketing page emphasises **Barcode Scanning** and promises a mobile app for Q2 2026. Exsited’s current dev environment lacks barcode scanning or any mobile interface, which is a significant gap relative to StockWise and competitors like Cin7 and Unleashed.

User Interface and Validation Improvements

Section / page	Current issues	improvement suggestions
Notifications panel Approval panel	Panel stays open unless bell icon clicked; clicking outside doesn’t close it 	Currently the bell-icon panel stays open until the bell is clicked and won’t close if the user clicks elsewhere. Use a standard overlay pattern—clicking outside the panel or pressing Esc should close it. This reduces cognitive friction and mirrors familiar patterns in other apps.
Account → Contacts (Phone Field)	Phone field allows alphabetic characters and invalid formats. No strict numeric validation. Error message unclear and not inline. 	Restrict input to numeric values and approved symbols (+, -, spaces). Add real-time inline validation and prevent saving invalid formats. Standardise validation across Phone, Mobile, Fax fields.

Account → Contacts (Mobile Field)	Validation error message is too long and technical. Does not clearly explain required format. 	Simplify error message (e.g., “Phone number must contain only numbers”). Highlight field in red and show clear guidance.
Payment Methods → BSB Field	BSB field accepts non-numeric characters and invalid length. No format validation. 	Enforce numeric-only validation (6 digits). Apply strict length rule. Show real-time validation error before save.
Payment Methods → Account Number	Account number accepts alphabetic characters. No format restriction. 	Allow numeric values only. Validate minimum and maximum length based on banking standards. Prevent invalid submission.
Account → Address	Address Line 1 is not mandatory. Incomplete addresses can be saved. 	Make Address Line 1 mandatory. Add structured validation for suburb, postcode, and state. Prevent saving incomplete addresses.
Communication → Email Search	Email search field does not dynamically filter results. No “No results found” state.	Implement real-time filtering while typing. Add “No results found” message. Improve usability for large datasets.

**Contacts → Additional
Contact Name**

Name field allows special characters (e.g., !, @, #). No input restriction.

Restrict special characters. Allow only letters, hyphens, and spaces. Improve data integrity and reporting accuracy.

General Form Validation

Required fields allow Save attempt before validation is triggered.
(System allows address to be saved without Address Line 1)

Disable Save button until required fields are completed. Apply consistent validation styling across all forms.

**Notification Centre >
Approval notifications**

Approval notifications are displayed as read-only messages. Users cannot click the notification to navigate directly to the relevant approval screen. Approvers must manually search for the account or purchase order to take action, which increases effort and time.

In the current Notification Centre, approval notifications are read-only and approvers must search for the associated document manually. Make each notification a link that takes the user directly to the relevant approval page or purchase order. This change

		reduces steps and improves task completion speed.
Responsiveness / mobile	Desktop-centric layout; horizontal menus cause scrolling	The current interface is desktop-centric; wide horizontal menus force scrolling on small screens. Implement a responsive design that adapts menus and tables for phones and tablets—collapse the side navigation into a hamburger menu, stack columns vertically on small screens, and use card-based layouts for lists and dashboards.

Competitor Comparison and Observations

The combined evaluations reveal that Exsited provides a foundation for a modern inventory system but lags behind established competitors in several areas. The table below summarises Exsited's strengths and weaknesses relative to StockWise, Cin7 Core and Unleashed:

Aspect	Exsited	StockWise / Competitors	Remarks
Real-time sync	Connectors exist for many channels; no dashboard or logs; ATP not calculated.	StockWise/Unleashed emphasise real-time sync with dashboards and overselling protection.	Exsited should implement ATP calculation and sync dashboards.
Multi-warehouse	Single warehouse; no transfer lifecycle or in-transit state.	Competitors support global multi-warehouse operations with transfer orders and FEFO logic.	Implement multi-warehouse framework, transfer states and allocation logic.
Batch/Serial tracking	Toggles exist but no mandatory entry,	Cin7 Core and Unleashed require	Add mandatory tracking, expiry/recall

	expiry management or recall.	batch/serial capture and provide FEFO and recall functions.	and scanning support.
Stock movement/audit	Activity tab shows limited fields; logs mutable; no export.	Competitors provide immutable audit trails with user, reason and before/after quantities.	Build comprehensive audit logging with export and rollback.
Reorder alerts	Basic low-stock thresholds; no forecasting or per-warehouse logic.	Competitors offer AI-driven demand forecasting, ABC analysis and dynamic buffers.	Add forecasting, safety stock and dashboards.
PO and receiving	Basic PO creation; no partial receipts, back-orders or configurable approvals.	Cin7 Core and Unleashed allow split receipts, back-order lines and multi-level approvals.	Expand PO lifecycle, partial receipts and approval workflows.
Stock transfers	Transfer orders remain in pending state; cannot fulfill or receive; no allocation.	Katana, Finale Inventory and Unleashed manage Draft → In Transit → Received lifecycle with allocation and approvals.	Implement full transfer lifecycle, approval and role-based permissions.
eCommerce integrations	Connectors exist but no SKU mapping or sync workflows.	Competitors provide =guided setup, real-time order import/export and reconciliation.	Develop integration wizard, mapping and dashboards.
Mobile & barcode scanning	No mobile app or barcode scanning in dev environment.	StockWise and competitors promise web-based barcode entry and mobile apps.	High priority for Exsited to develop mobile & scanning support.

Demand forecasting & manufacturing	No forecasting or manufacturing modules.	Cin7 Core's ForesightAI and Unleashed's AIM offer demand forecasting; Unleashed includes manufacturing modules.	Adding forecasting and basic manufacturing capabilities would improve competitiveness.
---	--	---	--

Competitors beyond StockWise

- **Cin7 Core:** Offers AI-powered demand forecasting (ForesightAI), barcode scanning and advanced manufacturing modules. Pricing is higher and per-user fees apply.
- **Unleashed:** Provides global multi-warehouse operations, barcode scanning, and the AIM module for forecasting. It also has a B2B e-Commerce portal and manufacturing features. Pricing is subscription based and per-user.
- **Exsited strengths:** Real-time sync across numerous channels, multi-warehouse control, flexible purchasing and fulfillment workflows, and affordable plans without per-user fees. Integration marketplace covers many accounting and commerce platforms.
- **Exsited weaknesses:** Lack of mobile barcode scanning, limited demand forecasting, no manufacturing module, and disabled features in demo environment. Adding these would enhance competitiveness.

Strategic Positioning

Exsited is well positioned as an affordable, integration-focused inventory solution for small to mid-sized businesses. However, to compete directly with Cin7 Core and Unleashed in multi-channel and enterprise environments, the platform must strengthen:

- Inventory reservation logic (ATP)
- Multi-location architecture and transfer lifecycle
- Audit & compliance controls
- Real-time monitoring and sync visibility

With focused development in these areas, Exsited could close the functional gap while maintaining its pricing advantage and simpler operational model.
